                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               weight, treating insulin resistance, Syndrome X, prolonging the survival of pancreatic cells, fibrosis, hyperlipidaemia, hyperamylinaemia, hyperprolactinaemia and prolectinomas. This sequence represents a peptide of a sematostatin agonist compound of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel somatostatin agonists, typically characterised by alkylation of the amide nitrogen, or its pharmaceutically acceptable salt. The novel somatostatin agonists are useful for binding one or more of human somatostatin subtype receptors 1, -2, -3, -4 and -5, and for eliciting a somatostatin subcipe effect, by administering a somatostatin agonist effect, by administering a somatostatin agonist esalt of it to a recipient in need of it. The somatostatin agonists are useful for treating a disease or condition in a human or other animal,
                                                                                                                                                                                                                                                                           Novel somatostatin agonist, useful for treating Cushing's syndrome, hyperparathyroidism, Paget's disease, hyperinsulinism, gastrinoma and Zollinger-Ellison syndrome, characterized by alkylation of amide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to novel somatostatin agonists, typically
characterised by alkylation of the amide nitrogen, or its
characterised by alkylation of the amide nitrogen, or its
plarmaceutically acceptable salt. The novel somatostatin abonists are
useful for binding one or more of human somatostatin abotype receptors
1,-2,-3,-4 and -5, and for eliciting a somatostatin abonist effect, by
administering a somatostatin agonist or a pharmaceutically acceptable
salt of it to a recipient in need of it. The somatostatin agonists are
useful for treating a disease or condition in a human or other animal,
including Cushing's syndrome, gonadotropinoma, hyperparathyroidism,
confort, adisease, VIPomm, nesididoblastosis, hyperinsullatism, agastrinoma,
Collinger-Ellison syndrome (AIDS) and other conditions, irritable bowel
confort, psoriasis, hypotension, panic attacks, scleroderma, small bowel
confort, psoriasis, hypotension, panic attacks, scleroderma, small bowel
confort, psoriasis, hypotension, panic attacks, scleroderma, small bowel
confort, psoriasis, hypotension, panic attacks, scleroderma, small bowel
confort, psoriasis, pancreatic ascites, lanksamia, meningioma, cancer
cachexia, acromegaly, restenosis, hepatoma, lung cancer, melanoma,
cachexia, acromegaly, restenosis, hepatoma, lung cancer, melanoma,
continibiting the accelerated growth of a solid tumour and decreasing body
weight, treating insulin resistance, Syndrome X, prolonging the survival
cof pancreatic cells, fibrosis, hyperlipidaemia, hyperprolactinaemia and prolactinomas. This sequence represents a peptide
cof a somatostatin agonist compound of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Osteopathic, cytostatic, antidiarrhoeic, antiinflammatory; antipsoriatic, hypertenstive, dermatological, antithyroid; immunomodulator; vasotropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel somatostatin agonist, useful for treating Cushing's syndrome, hyperparathyroidism, Paget's disease, hyperinsulinism, gastrinoma and Zollinger-Ellison syndrome, characterized by alkylation of amide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to novel somatostatin agonists, typically characterised by alkylation of the amide nitrogen, or its pharmacterised by alkylation of the amide nitrogen, or its pharmacterised by alkylation of the amide nitrogen, or its pharmacterin acceptable salt. The novel somatostatin aponist are useful for binding one or morre of human somatostatin abonist effect, by administering a somatostatin agonist effect, by administering a somatostatin agonist effect, by administering a disease or condition in a human or other animal, including Cushing's syndrome, gonadotropinoma, hyperparathyroidism, space, viPoma, nesidioblastosis, hyperinsulinism, gastrinoma, collinger-Ellison syndrome, hypersecretory diarrhoea related to acquired immunodeficiency syndrome (AIDS) and other conditions, irritable bowel syndrome, pancreatitis, Crohn's disease, systemic scleroderma, small bowel obstruction, gastroesophageal reflux, duodenogastric reflux, Grave's disease, polycystic ovary disease, upper gastrointestinal bleeding, cacheria acromegaly, restenosas, lung cancer, melanoma, cacheria, acromegaly, restenosas, lung cancer, melanoma, cacheria, acromegaly, restenosas, lung cancer, melanoma, cacheria, acromegaly, restenosas, hyparome, hyparome, hyparome, hyparome, lung cancer, minibiting the accelerated growth of a solid tumour and decreasing body weight, treating insulin resistence, Syndrome, K, proolonging the survival
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of pancreatic cells, fibrosis, hyperlipidaemia, hyperamylinaemia, hyperprolactinaemia and prolactinomas. This sequence represents a peptide of a somatostatin agonist compound of the invention
antilipaemic; somatostatin agonist; Cushing's syndrome; gonadotropinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel somatostatin agonist, useful for treating Cushing's syndrome, hyperparathyroidism, Paget's disease, hyperinsulinism, gastrinoma and Zollinger-Ellison syndrome, characterized by alkylation of amide
                                                                                                                                                                                          /note= "Modified by N-Methyl"
                                                                                                                                                                                                                                     /note= "C-terminal amide"
                                                                                                                                                note= "D-form residue"

                                                                                                                                                                                                    17-0CT-2002
                                                                                                                                                                                                                                                                                                                                      nitrogen
```

The invention relates to novel somatostatin agonists, typically characterised by alkylation of the amide nitrogen, or its characterised by alkylation of the amide nitrogen, or its characterised by alkylation of the amide nitrogen, or its useful for binding one or more of human somatostatin subtype receptors 1,-2,-3,-4 and -5, and for eliciting a somatostatin agonist effect, by administering a somatostatin agonist or a pharmaceutically acceptable alt of it to a recipient in need of it. The somatostatin agonists are useful for treating a disease or condition in a human or other animal, including Cushing's syndrome, gonadorropinoma, hyperparathyroidism, Paget's disease, VIPoma, nesidioblastosis, hyperparathyroidism, cancer, Ellison syndrome (AIDS) and other conditions, irritable bowel syndrome, pancreatitis, crohn's disease, systemic sclerosis, thyroid cancer, psoriasis, hypotension, anima and calerosis, thyroid cancer, psoriasis, hypotension, disease, systemic sclerosis, small bowel obstruction, gastroesophageal reflux, duodenogastric reflux, Grave's disease, polycystic ovary disease, upper gastrointestinal bleeding, pancreatic ascites, leukaemia, meningioma, cancer cachexia, acromegaly, restenosis, hepatoma, lung cancer, melanoma, cancer, inhibiting the accelerated growth of a solid tumour and decreasing body, inhibiting the accelerated growth of a solid tumour and decreasing body. weight, treating insulin resistance, Syndrome X, prolonging the survival of pancreatic cells, fibrosis, hyperlipidaemia, hyperpamylinaemia, hyperprolactinaemia and prolactinomas. This sequence represents a peptide of a sematostatin agonist compound of the invention cancer

The invention relates to novel sometostatin agonists, typically characterised by alkylation of the amide nitrogen, or its characterised by alkylation of the amide nitrogen, or its pharmacceutically acceptable salt. The novel sometostatin agonists are useful for binding one or more of human somatostatin subtype receptors - 1, -2, -3, -4 and -5, and for eliciting a somatostatin agonist effect, by administering a somatostatin agonist acceptable concluding to the somatostatin agonists are salt of it to a recipient in need of it. The somatostatin agonists are useful for treating a disease or condition in a human or other animal, concluding Cushing's syndrome, spandortopinoma, hyperparathyroidism, gastrinoma, paracteristic agonists are gradional parachyrome (AlDS) and other conditions, irritable bowel syndrome, pancreatitis, Crohn's disease, systemic solerosis, thyroid cancer, psoriasis, hypotension, panic attacks, scleroderma, small bowel obstruction, gastroseophageal reflux, ducdenogastric reflux, Grave's disease, polycystic ovary disease, upper gastrointestinal bleeding, coheruncion, gastroseophageal reflux, ducdenogastric reflux, Grave's disease, polycystic ovary disease, upper gastrointestinal bleeding, inhibiting the accelerated growth of a solid tumour and decreasing body weight, treating insulin resistance, Syndrome X, prolonging the survival configuration agonist compound of the invention
                                                                                                                                                                  Osteopathic, cytostatic, antidiarrhoeic, antiinflammatory, antipsoriatic, hypertenstive, dermatological, antithyroid; immunomodulator; vasotropic; antilipaemic; somatostatin agonist; Cushing's syndrome; gonadotropinoma; hyperparathyroidism; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel somatostatin agonist, useful for treating Cushing's syndrome, hyperparathyroidism, Paget's disease, hyperinsulinism, gastrinoma and Zollinger-Ellison syndrome, characterized by alkylation of amide
                                                                                                                                                                                                                                                                                                                                                    'notes "Modified by N-Methyl"

The invention relates to novel somatostatin agonists, typically characterised by alkylation of the amide nitrogen, or its characterised by alkylation of the amide nitrogen, or its characterised by alkylation of the amide nitrogen, or its set in the plantaceutically acceptable substitution one or more of human somatostatin subtype receptors useful for binding one or more of human somatostatin agonist effect, by administering a somatostatin agonist or a pharmaceutically acceptable salt of it to a recipient in need of it. The somatostatin agonists are useful for treating a disease or condition in a human or other animal, including Cushing's syndrome, gonadotropinoma, hyperparathyroidism, paget's disease, VIPoma, nesidioblastosis, hyperinsulinism, gastrinoma, collinger-Ellison syndrome (AIDS) and other conditions, irritable bowel immunodeficiency syndrome (AIDS) and other conditions, irritable bowel cancer, psoriasis, hypotension, disease, systemic sclerosis, thyroid cancer, psoriasis, hypotension, panic attacks, scleroderma, small bowel obstruction, gastroesophageal reflux, duodenogastric reflux, Grave's
                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                         Osteopathic, cytostatic, antidiarrhoeic, antiinflammatory; antipsoriatic; hypertenstive; dermatological, antithyroid; immunomodulator; vasotropic; antilipaemic; somatostatin agonist; Cushing's syndrome; gonadotropinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel somatostatin agonist, useful for treating Cushing's syndrome, hyperparathyroidism, Paget's disease, hyperinsulinism, gastrinoma and Zollinger-Ellison syndrome, characterized by alkylation of amide
                                                                                 Gaps

The novel somatostatin agonists are useful for binding one or more of human somatostatin subtype receptors 1,-2,-3,-4 and -5, and for eliciting a somatostatin agonist effect, by administering a somatostatin agonist or a pharmaceutically acceptable salt of it to a recipient in need of it. The somatostatin agonists are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel somatostatin agonist, useful for treating Cushing's syndrome, hyperparathyroidism, Paget's disease, hyperinsulinism, gastrinoma and Zollinger-Ellison syndrome, characterized by alkylation of amide

```
The invention relates to novel somatostatin agonists, typically characterised by alkylation of the amide nitrogen, or its pharmaceutically acceptable salt. The novel somatostatin agonists are useful for binding one or more of human somatostatin subtype receptors 1,-2,-3,-4 and -5, and for eliciting a somatostatin subtype receptors administering a somatostatin agonist or a pharmaceutically acceptable salt of it to a recipient in need of it. The somatostatin agonists are useful for treating a disease or condition in a human or other animal, including Cushing's syndrome, gonadotropinoma, hyperparathyroidism, collinger-Ellison syndrome, propresertory diarrhoea related to acquired immunodeficiency syndrome (AIDS) and other conditions, irritable bowel syndrome, pancreatitis, Crohn's disease, systemic sclerosis, thyroid cancer, psoriasis, hypotension, disease, systemic sclerosis, thyroid cancer, psoriasis, hypotension, disease, systemic sclerosis, thyroid obstruction, gastroesophageal reflux, duodenogastric reflux, Grave's classese, polycystic ovary disease, upper gastrointestinal bleeding, pancreatic pseudocysts, pancreatic ascites, leukaemia, meningioma, cancer cachexia, acromegaly, restenosis, hepatoma, lung cancer, melanoma, cachexia, acromegaly, restenosis, hepatoma, lung cancer, melanoma, cachexia, acromegaly, restenosis, sound contexts, melanoma, cachexia, acromegaly, restenosis, hepatoma, lung cancer, he accelerated growth of a solid tumour and decreasing body cancer, and cancer cachexia, acromegaly, restenosis, decreasing body cancer, and cancer cachexia, acromegaly, restenosis, as solid tumour and decreasing body cancer, and cachexia, acromegaly acromed cachexia, acromegaly, restenosis, a solid tumour and decreasing body.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                 weight, treating insulin resistance, Syndrome X, prolonging the survival of pancreatic cells, fibrosis, hyperlipidaemia, hyperamylinaemia, hyperprolactineemia and prolactinomas. This sequence represents a peptide of a somatostatin agonist compound of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Somatostatin; acromegaly; radiolocalisation; blood-brain barrier; cancer;

The invention discloses a new compound comprising a somatostatin component and a spacer component. The spacer component carries at least one anticancer drugs and is connected to the somatostatin analogue through a covalent bond. Wost cytotoxic anticancer drugs lead to toxic side effects due to their lack of a selective drug delivery system. Somatostatins function through cellular membrane receptors, known as somatostatins function through cellular membrane receptors, known as somatostatins function tumour cells, such as carcinoid, islet of the pancreas, paragangliomas and small carcinomas of lungs. Somatostatin analogues may be used as a carrier system targeting the malignant tumour cells and they are preferred to the original somatostatins because they are smaller in size, higher in affinity and more stable. The compound enhances the upport cells, increasing its therapeutic efficacy, while reducing the side effects. The sequence presented is the Paclitaxal-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           wasotropic, anti-inflammatory, antidiarrhoeic, anti-HIV; dermatological; wasotropic, anti-inflammatory; antidiarrhoeic, anti-HIV; dermatological; wasotropic, anti-inflammatory; antidiarrhoeic, integrated in transparent of the companies of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transparent of transpa

The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidiarhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic, antibacterial, immunomodulator, hypertensive, tranquiliser, antilipaemic, nephrotropic, antiulcer, antiarthritic, hypotensive, anorectic or antiaddictive activity through action as a dopamine receptor agonist and somatostain receptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidism, hyperaldosteronism, Helicobacter pylori proliferation, acromegaly,
orthostatic; hypotension; postprandial hypotension; panic attack; as secreting adenoma; acromegally; TSH secreting adenoma; prolactin secreting adenoma; insulinoma; glucagonoma; diabetes mellitus; hyperlipidaemia; insulin insensitivity; Syndrome X; angiopathy; hyperlipidaemia; insulin insensitivity; Syndrome X; angiopathy; proliferative retinopathy; dawn phenomenon; nephropathy; gastric acid secretion; peptic ulcer; entercoutaneous fistula; pancreaticocutaneous fistula; dumping syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to novel somatostatin-dopamine chimeric analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "An N-terminal dopamine derivative (Dop1 to Dop6 inclusive) is attached to a Lystdopamine derivative) modified residue, where this second dopamine derivative must match the type occurring at the N-terminus, e.g. Dop1-Lys(Dop1), Dop2-Lys(Dop2) etc."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             somatostatin-dopamine chimeric analogue; agonist; cyclic; vascular disease; anglogenesis; connective disease; scleroderma; immune disease; rheumetiod arthritis; gastrointestinal tract disorder; irritable bowel syndrome; metabolic disease; hyperlipidaemia; cachexia; cancer; musculoskeletal disorder; panic disorder; opioid overdose; cytostatic; osteopathia; antidiabelic; dermachological; antimagiogenic; ophibalmological; antidiabelic; dermachological; immunosuppressive; antiarthritic; antirheumatic; antilifemmatory; antilipemic; analgesic; antianginal; anorecic; immunomodulator; cardiant; tranquillizer; antiaddictive; acromegaly; neoplasia; neuroendocrine tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.

This invention relates to novel somatostatin-dopamine chimeric analogues that comprise at least one moiety that binds to one or more dopamine receptors and at least one moiety that binds to one or more dopamine receptors, or a salt derived thereof. Specifically, it refers to analogues that may be used in vitro or in vivo for research, diagnostic of dopamine i.e. working as receptor agonists. The present invention describes analogues with specificity for different types of somatostatin and describes analogues with specificity for different types of somatostatin creceptor subtypes that are accordingly associated with the treatment of particular diseases or conditions. As such, these analogues may be used to treat neoplasia and acromegaly as well as various neuroendocrine to treat neoplasia and acromegaly as well as various neuroendocrine to treat disorders e.g. irritable bowel syndrome, metabolic diseases e.g. created diseases e.g. rheumatoid arthitis; gastrointeefinal tract disorders e.g. irritable bowel syndrome, metabolic diseases e.g. hyperlipidaemia, cachexia, cancer, a musculoskeletal disorder, panic disorder or an opioid overdose. Accordingly, they exhibit activities that inclear or an opioid overdose. Accordingly, they exhibit activities that antiatianterior, antiinflammatory, antiulcer, antiangiogenic, ophthalmological, antidiabetic, dermatological, immunosuppressive, antiandisarhecic, nephrotropic, hepatotropic, antilipsemic, analogue of the invention.

Canlidarious and antiadiadictic activities as somatostatin-dopamine chimeric analogue of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                somatostatin-dopamine chimeric analogue, cytostatic; antithyroid;
vasotropic; anti-inflammatory; antidiarrhoeic; anti-HIV; dermatological;
anti-diabetic; osteopathic; antibacterial; immunomodulator; hypertensive;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New chimeric analog comprising at least one moiety which binds to one or more somatostatin and dopamine receptor(s) useful to treat e.g. neuroendocrine tumor, vascular diseases, connective tissue disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Somatostatin-dopamine chimeric analogue-related peptide 64.
   compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidiarrhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidictive activity through action as a dopamine receptor agonist and somatostatin receptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidism, carcomegaly, restenosis, Crohn's disease, systemic sclerosis, external and internal panoreatic pseudocysts and ascites, ViPoma, nesidoblastosis, hyperinalinism, gastrinoma, zollinger-Blison Syndrome, diarrhoea, AIDS related diarrhoea, chemotherapy related diarrhoea, scleroderma, irritable coverl syndrome, panoreatitis, small bowel obstruction, gastrosenophageal reflux, duodenogastric reflux, Cushing's syndrome, gonadotropinoma, cancer cachexia, orthostatic, hypotension, postprandial caver, hypotension, postprandial secreting adenomas, acromegally, TSH secreting adenomas, insulinoma, diabetes mellitus, hypotension, postprandial secreting adenomas, insulinoma, cancer cachexia, orthostatic, hypotension, pastric caid secreting adenomas, insulinoma, cancer cachexia, orthostatic, hypotension, pastric adiabetes mellitus, hypotension, pastric acid secreting adenomas, insulinome, syndrome, watery diarrhoea syndrome, yastric acid secreting adenomas, insulinome, syndrome, pancreatitis, gastrointestinal hormone secreting tumour, nephropathy, gastric acid secretion, peptic ulcer, enterocutaneous fistula, dumping syndrome, watery diarrhoea syndrome, pancreatitis, allogath trefedency obserty and oppoint of engagonesis, arthritis, allogathy elected in electrome is sull dumping syndrome, pancreatitis, and somatostethin receptor agonist effects in vivo with engance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                    This invention relates to novel somatostatin-dopamine chimeric analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a neptide which was need to
                                                                                                                                                                                                                          New somatostatin-dopamine chimeric analogs useful for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        produce the somatostatin-dopamine chimeric analogues of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    figura, pancreaticocutaneous fistula, dumping syndrome, watery diarrhoea syndrome, pancreatitis, gastrointestinal hormone secreting tumour, angiogenesis, arthritis, allograft rejection, graft vessel bleeding, portal hypertension, gastrointestinal bleeding, obserty and opioid overdose. The compounds simultaneously elicit dopamine receptor agonist and somatostatin receptor agonist effects in vivo with enhanced
                  antibacterial, immunomodulator, hypertensive, tranquiliser, antilipaemic, antiadictive activity through action as a dopamine receptor agonist antiaddictive activity through action as a dopamine receptor agonist and somatostatin receptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidism, hyperaldosteronism, Helicobacter pylori proliferation, acromegaly, restenosis, Crohn's disease, systemic sclerosis, external and internal pancreatic pseudocysts and ascites, UPPoma, needdoblastosis, hyperinsulinism, gastrinoma, Zollinger-Ellison Syndrome, diarrhoea, AIDS related diarrhoea, chemotherapy related diarrhoea, scleroderma, irritable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sometostatin-dopamine chimeric analogue; agonist; cyclic; vascular disease; angiogenesis; connective disease; scleroderma; immune disease; rheumatoid arthritis; gastrointestinal tract disorder; irritable bowel syndrome; metabolic disease; hyperlipidaemia; cachexia; cancer; musculoskeletal disorder; panic disorder; opioid overdose; cytostatic; oseopathic; antithyroid; vasotropic; antiangiogenic; ophibalmological; antidiabetic; dermatological; immunosuppressive; antiarthritic; antirheumatic; antinflammatory; antiulcer; antianginal; anorectic; immunosublator; cardiant; tranquillizer; antianginal; anorectic; immunosublator; cardiant; tranquillizer; antiaddictive; acromegaly; neopleasia; neuroendocrine tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "An N-terminal dopamine derivative (Dop1 to Dop6 inclusive) is attached to a Lyst diopamine derivative) modified residue, where this second dopamine derivative must match the type occurring at the N-terminus, e.g.
                                                                                                                                                                                                                                                                          bowel syndrome, parceautities, small bowel obstruction, gastroesophageautefully, duodenogastric reflux, Cushing's syndrome, gonadotropinome, hyperparathyroidism, Graves disease, diabetic neuropathy, Paget's disease, polycystic ovary disease, thyroid cancer, hepatoma, leukaemia, meningioma, cancer cachexia, orthostatic, hypotension, postprandial hypotension, panic attacks, GH secreting adenomas, acromegally, TSH secreting adenomas, insulinoma, glucagonoma, diabetes mellitus, hyperlipidaemia, insulinoma, syndrome X, angiopathy, proliferative retinopathy, dawn phenomenon, nephropathy, gastric acid secretion, peptic ulcer, entercottaneous fistula, pancreaticocutaneous fistula, dumping syndrome, watery diarrhoe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    produce the somatostatin-dopamine chimeric analogues of the invention.
antidiarrhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic,

tumours, vascular diseases e.g. angiogenesis, connective diseases e.g. scleroderma, immune diseases e.g. angiogenesis, connective diseases e.g. scleroderma, immune diseases e.g. rheumatoid arthritis, gastrointestinal tract disorders e.g. irritable bowel syndrome, metabolic diseases e.g. hyperlipidaemia, cachexia, cancer, a musculoskeletal disorder, panic disorder or an opioid overdose. Accordingly, they exhibit activities that include cytostatic, osteopathic, antithyroid, vasotropic, antiangiogenic, ophthalmological, antiandabetic, darmatological, immunosuppressive, antiangiarthyritic, antirheumatic, antiinflammatory, antiulcer, antiangiogenic, antianginal, ancectic, immunosuppressive, antiangidictive. This peptide sequence is a somatostatin-dopamine chimeric analogue of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New chimeric analog comprising at least one moiety which binds to one or more somatostatin and dopamine receptor(s) useful to treat e.g. neuroendocrine tumor, vascular diseases, connective tissue disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       that comprise a least one moiety that binds to one or more somatostatin receptors and at least one moiety that binds to one or more dopamine receptors and at least one moiety that binds to one or more dopamine receptors, or a salt derived thereof. Specifically, it refers to analogues that may be used in vitro or in vivo for research, diagnostic and therapeutic agents to enhance the activity of somatostatin and dopamine i.e. working as receptor agonists. The present invention receptor subtypes that are accordingly associated with the treatment of particular diseases or conditions. As such, these analogues may be used to treat neoplasia and acromegaly as well as various neurondocrine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          invention relates to novel somatostatin-dopamine chimeric analogues

This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidiarrhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic, antidiarrhoeic, anti-HIV, dermatological, antidiated antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, hypotensive, anorestic or antidiation acceptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidism, commatostatin receptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidism, hypertaldosteroniam, Helicobacter yylori proliferation, accomegaly, hyperinsulinism, gastrinoma, Zollinger-Blison Syndrome, diarrhoea, AIDS related diarrhoea, chemotherapy related diarrhoea, scleroderma, irritable collar syndrome, pancreatitis, small bowel obstruction, gastrocesophageal reflux, duodencgastric reflux, Glasease, polysostic over disease, diabetic neuropathy, Paget's disease, hypotension, pagetration, pagetronia, cancer cachexia, orthostatic, hypotension, postprandial hypotension, panic attacks, GH secreting adenomas, insullinoma, glucagonoma, diabetes mellitus, hyperligidaemia, insullin insensitivity, Syndrome, pancreatitis, and secretion, peptic ulcer, enterocutaneous fistula, dumping syndrome, watery diarrhoea syndrome, pancreatitis, gastrointestinal hormone secreting tumour, sundrome, pancreatitis, gastrointestinal hormone secreting tumour, portal hypertension, gastrointestinal heading, obesity and opicid coverdose. The compounds simultaneously elicit dopamine receptor agonist effects in vivo with entain and hyperic and secretion relative secreting decretion and somatosettin acceptor agonist effects in vivo with entains and popical projecical activity over the native general property.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to
                                                                                                                                                                                                                                                                                                                                                                           New somatostatin-dopamine chimeric analogs useful for the treatment of

e.g. lung cancer.

```
This invention relates to novel sometostatin-dopaminic connected analogues or their salte. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antibacterial, immunomodulator, hypertensive, tranquiliser, antilipaemic, antibacterial, immunomodulator, hypertensive, tranquiliser, antilipaemic, antibacterial, immunomodulator, hypertensive, tranquiliser, antilipaemic, consideration, antimathritic, hypotensive, anticipaemic, constituted activity through action as a dopamine receptor agonist and sometostatin receptor agonist. The invention may be useful for the treatment of lung cancer, plane, anorexia, hypothyroidism, concer, gloma, anorexia, hypothyroidism, crestenosis, crohn's disease, systemic sclerosis, external and internal pancreatic pseudocysts and ascites, VIPoma, nesidoblastosis, hypothyroidism, gastrinoma, zollinger-Ellison Syndrome, diarrhoea, AIDS related diarrhoea, chemotherapy related diarrhoea, sclerosphageal conversation; small bowel obstruction, gastroceophageal conversation; pancreatitis, small bowel obstruction, gastroceophageal conversation; pancreatitis, small bowel obstruction, gastroceophagea conversation; pancreatitis, small bowel obstruction, gastroceophagea conversation; pancreatitis, small cancer, hepatoma, leukaemia, meningioma, cancer cachexia, orthostatic, hypotension, postprandial conversation, pancreatitis, generating adenomas, insulinoma, diabetes mellitus, hyporlipidaemia, insulinoma, diabetes mellitus, hyporlipidaemia, insulinoma, concerting adenomas, prolactin secreting adenomas, insulinoma, concerting adenomas, prolactin secreting adenomas, diabetes mellitus, hyporlipidaemia, insulinoma, concerting adenomas, prolactin secreting adenomas, anthritis, sullografit rejection, gastroceanial diapetes mellitus, dumping syndrome, watery diarented confinemented pandrome, pancreatitis, allografit rejection, gastroceanial hypotension, dastroceanial hypotension, gastroceanial dumping syndrome, pancreatitis, and sometosterin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        wasotropic; anti-inflammatory; antidiarrhoeic; antithyroid;

Claim 3; Page 103; 85pp; English.

e.g. lung cancer.

This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidiarrhoeic, anti-inflammatory, antidiarrhoeic, anti-inflammatory, antidiarrhoeic, anti-inflammatory, antidiarrhoeic, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, and antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier, antidier vasorropic; anti-inflammatory; antidarrhoeic; anti-HIV; dermatological; anti-diabetic; osteopathic; antidarrhoeic; anti-HIV; dermatological; anti-diabetic; osteopathic; antidacterial; immunomodulator; hypertensive; tranquiliser; antiathoric; antidadditive; dopamine receptor agonist; hypotensive; anorectic; antiadditive; dopamine receptor agonist; whypothyroidism; hyperaldosteronism; Helicobacter pylori proliferation; hypothyroidism; hyperaldosteronism; Helicobacter pylori proliferation; acromegaly; restenosis; Crohn's disease; systemic sclerosis; pancreatic pseudocyst; ascite; VIPoma, nesidoblastosis; hyperinsulinism; gastrinoma; Zollingar-Ellison Syndrome; diarrhoea; scleroderma; irritable bowel syndrome; pancreatitis; amall bowel obstruction; irritable bowel syndrome; pancreatitis; amall bowel obstruction; gastroesophageal reflux; duodenogastric reflux; Cushing's syndrome; gonadotropinoma; hyperparathyroidism; Graves disease; subbetic neuropathy; Paget's disease; polycystic ovary disease; thyroid cancer; hepstoma; leukeenia; meningioma; cancer cachexia; orthostatic; hypotension; postprandial hypotension; panic attack; biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention. Gaps somatostatin-dopamine chimeric analogue; cytostatic; antithyroid; ö Somatostatin-dopamine chimeric analogue-related peptide 62 71.2%; Score 57; DB 7; Length 13; 100.0%; Pred. No. 2.6; Indels ; Similarity 100.0%; Pred. No. 2.68; Conservative 0; Mismatches ADI14952 standard; peptide; 14 AA. 22-APR-2004 (first entry) 4 YCFWKTCT 11 YCFWKTCT 13 Query Match Best Local Similarity Matches 8; Conserv Sequence 13 AA; ADI14952; RESULT 28 AD114952

```
This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasorropic, antililammatory, antidarrhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, antidiarrhoeic, hypertensive, tranquiliser, antilipaemic, nephrotropic, antidiarrhoeir, hypertensive, tranquilipaemic, antiddictive activity through action as a dopamine receptor agonist and antiddictive activity through action as a dopamine receptor agonist creatment of lung cancer, glioma, anorexia, hypothyroidism, transman, proliferation, acromegaly, restences of Crohn's disease, systemic sclerosis, external and internal pactachest genedocypts and ascites, vipoma, nesidoblastosis, pancreatic pseudocypts and ascites, vipoma, nesidoblastosis, calated diarrhoea, chemotherapy related diarrhoea, scleroderma, irritable power syntomism, gastrinoma, 2011ninger-Ellison Syndrome, diarrhoea, and calated diarrhoea, scleroderma, irritable reflux, duodenogastric reflux, customing syndrome, gonadocropinoma, hyperparathyroidism, Graves disease, diabetic neuropathy, Paget's meningioma, cancer cachexia, orthoestatic, hypotension, postprandial hypotension, panic attacks, GH secreting adenomas, acromegally, TSH
                                                                                                                                                                                                                                                                                                                                        /note= "Amino acid is Doc. Bound to 7-propyl-
4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-yl-
methylsulfanyl-acetic acid"
               prolactin secreting demonal insulinoma; glucagonoma; diabetes mellitus; prolactin secreting adenoma; insulin insensitivity; Syndrome X; anglopathy; hyparlipidaemia; insulin insensitivity; Syndrome X; anglopathy; gastric active retinopathy; dawn phenomenon; nephropathy; gastric acid secretion; peptic ulcer; entercoutaneous fistula; pancreaticocutaneous fistula; dumping syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New somatostatin-dopamine chimeric analogs useful for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "Residue forms a bond to residue 13 to form a cyclic peptide"
                                                                                                                       watery diarrhoea syndrome; pancreatitis; gastrointestinal hormone secreting tumour; angiogenesis; arthritis; allograft rejection; graft vessel bleeding; portal hypertension; gastrointestinal bleeding; obesity; opioid overdose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "Residue forms a bond to residue 8 to form cyclic peptide"
  secreting adenoma; acromegally; TSH secreting adenoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (SCRC ) SCRAS SOC CONSEILS RECH & APPL SCI.
                                                                                                                                                                                                                                                                                                                                                                                                                              notes "Amino acid is Doc"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note= "C-terminal amide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Moreau J;
                                                                                                                                                                                                                                                                                                                                                                                                                                                    . .7
note= "D-form residue"

secreting adenomas, prolactin secreting adenomas, insulinoma, diabetes mellitus, hyperlipidaemia, insulin insensitivity, syndrome X, angiopathy, proliferative retinopathy, dawn phenomenn, nephropathy, gastric acid secretion, peptic ulcer, entercoutameous fistula, pancreaticocutameous fistula, dumping syndrome, watery diarrhoes syndrome, pancreatitis, gastrointestinal hormone secreting tumour, angiogenesis, arthritis, allograft rejection, graft vessel bleeding, portal hypertension, gastrointestinal bleeding, obesity and opioid overdose. The compounds simultaneously elicit dopamine receptor agonist and somatostatin receptor agonist effects in vivo with enhanced biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            note= "D-form residue, optional tert-butyl modification"

It is an example of peptide agents of the invention that comprise a biologically active peptide, such as somatostatin or bombesin, conjugated to a chemical compound through a linker that maintains the peptide as biological activity. The peptide agents may also include a cytostatic or therapeutic agent, label or chelating group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, tumours of neuroendocrine origin (for e.g. carcinoid syndrome), and angiogenic blood vessels (claimed). Other diseases that can also be treated are inflammatory bowel disease, autoimmune disorders, rheumatoid arthritis, neoplastic cells or aberrantly proliferating cells, and acromegaly. Peptide JF-08-87A has the ability to inhibit growth hormone clease from primary cultures of rat pituitary cells, having an ICSO of 0.16 nM (compared with 0.15 nM for sematostatin-14). Note: The present sequence is identified as SEQ ID 2 in the disclosure (page 16), but it is not the same as the sequence given as SEQ ID 2 in the sequence listing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      somatostatin-dopamine chimeric analogue, cytostatic; antithyroid, vasotropic; anti-inflammatory; antidiarrhoeic; anti-HV; dermatological; anti-diabetic; osteopathic; antidiacterial; immunomdulator; hypertensive; tranquiliser; antilipaemic; nephrotropic; antiulcer; antiarrhritic; hypotensive; anorectic; antiaddictive; dopamine receptor agonist; pamatostatin receptor agonist; lung cancer; glioma; anoreckia; hypothyroidism; hyperaldosteronism; Helicobacter pylori proliferation; acromegaly; restenosis; Crohn's disease; systemic sclerosis;

The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.

The present sequence is that of a peptide analogue conjugate that is an actaive peptide agents of the invention that comprise a biologically active peptide, such as somatostatin or bombesin, conjugated to a chemical compound through a linker that maintains the peptide's biological activity. The peptide agents may also include a cytostatic or therapeutic agent, label or chelating group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, tumours of neuroendocrine origin (for e.g. carcinoid syndrome), and angiogenic blood vessels (claimed). Other diseases that can also be treated are inflammatory bowel diseases, autoimmune disorders, rheumatoid arthritis, neoplastic cells or aberrantly proliferating cells, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Biologically active peptides such as somatostatin or bombesin conjugated to chemical compounds through linkers, useful for treating tumors of the lung and breast, carcinoid syndrome, and tumors of angiogenic blood vessels.
                                                                                                                                                                                                                                                                                                                                                               /note= "optionally modified with 0-2,6- dichlorobenzyl"

The present sequence is that of a somatostatin analogue peptide. It is an example of peptide agents of the invention that comprise a biologically active peptide, such as somatostatin or bombeain, conjugated to a chemical compound through a linker that maintains the peptide's to biological activity. The peptide agents may also include a cytostatic or therapeutic agent, label or chelating group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, tumours of neuroendocrine origin (for e.g. carcinoid syndrome), and can approach of colon despels (claimed). Other diseases that can also be treated are inflammatory bowel disease, autoimmune disorders, rheumatoid arthritis, neoplastic cells or aberrantly proliferating cells, and archmetic primary cultures of rat pituitary cells, having an ICSO of claimed with 0.15 nM for somatostatin-14)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              KW assocratin-dopamine chimeric analogue; cytostatic; antithyroid; wasocropic; anti-inflammatory; antidiarrhoeic; anti-HIV; dermatological; wasocropic; anti-inflammatory; antidiarrhoeic; anti-HIV; dermatological; wanti-diabetic; osteopathic; antibacterial; immunomodulator; hypertansive; rranquiliser; antilipaemic; nephrotropic; antiulcer; antiarthritic; hypothyroidism; hyperaldosteronism; Helicobacter pylori proliferation; acromegaly; restenosis; Crohn's dlease; systemic solarosis; proliferation; acromegaly; restenosis; Crohn's dlease; systemic solarosis; hyperaldosterentism; hapocratic pseudocyst; ascite; ViPoma; nesidoblastosis; hyperinsulinism; My pancreatic pseudocyst; ascite; ViPoma; nesidoblastosis; hyperinsulinism; My astrinoma; 2011inger-Ellian Syndrome; diated diarrhoea; clemotherapy related diarrhoea; scleroderma; irritable bowel syndrome; pancreatitis; small bowel obstruction; my irritable bowel syndrome; pancreatitis; small bowel obstruction; diabetic neuropathy; Paget's disease; polycystic ovary disease; thyroid cancer; hepatoma; leukaemia; meningioma; cancer cachexia; throcatoric hypothyman; leukaemia; meningioma; cancer cachexia; my prolactin secreting adenoma; leukaemia; meningioma; dancer cachexia; prolactin secreting adenoma; insulinoma; glucagonoma; diabetes mellitus; My proliferative retinopathy; dam phenomenon; nephropathy; gastric acid secretion; peptic ulcer; enterocutaneous fistula; dumping syndrome; meningiome; cachexia; my proliferative retinopathy; dam phenomenon; nephropathy; dam phenomenon; nephropathy; dam phenomenon; nephropathy; dam phenomenon; nephropathy; dam phenomenon; nephropathy; dam phenomenon; nephropathy; dam phenomenon; nephropathy; dam phenomenon; nephropathy; dam phenomenon; nephropathy; dam phenomenon; nephropathy; dam phenomenon; nephropathy; dam phenomenon; nephropathy; dam phenomenon; nephropathy; dam phenomenon; nephropathy; dam phenomenon; nephropathy; dam phenomenon; nephropathy; dam phenomenon; dam phenomenon; dam phenomenon; dam phenomenon; dam phenomenon; da
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
Biologically active peptides such as somatostatin or bombesin conjugated to chemical compounds through linkers, useful for treating tumors of the lung and breast, carcinoid syndrome, and tumors of angiogenic blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          watery diarrhoea syndrome; pancreatifis;
gastrointestinal hormone secreting tumour; anglogenesis; arthritis;
allograft rejection; graft vessel bleeding; portal hypertension;
gastrointestinal bleeding; obesity; opioid overdose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidarhoeic, anti-inflammatory, antidarhoeic, anti-inflammatory, antibacterial, immunomodulator, hypottensive, tranquiliser, antilipaemic, nephrotropic, antiulcer, antiarthritic, hypotensive, anorectic or antiaddictive activity through action as a dopamine receptor agonist and somatostatin receptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorexial, hypothyroidism, hyperaldosteronism, Helicobacter pylori proliferation, acromegaly, hyperaldosteronism, Helicobacter pylori proliferation, acromegaly, pancreatic pseudocysts and ascites, VIPoma, nesidoblastosis, hyperinsulinism, gastrinoma, 20llinger-Ellison Syndrome, diarrhoea, Alds related diarrhoea, chemotherapy related diarrhoea, scleroderma, irritable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               bowel syndrome, pancreatitis, small bowel obstruction, gastroesophageal reflux, duodenogastiric reflux, Cubhing's syndrome, gonaddropinoma, hyperparathyroidism, Graves disease, diabetic neuropathy, Paqet's disease, polycystic ovary disease, thyroid cancer, hepatoma, leukaemia, meningioma, cancer cachexia, orthostatic, hypotension, postprandial hypotension, panic attacks, GH secreting adenomas, acromegally, TSH secreting adenomas, insulinoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New somatostatin-dopamine chimeric analogs useful for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "Residue forms a bond to residue 19 to form a

KW somatostatin-dopamine chimeric analogue; cytostatic; antithyroid; wasotropic; anti-inflammatory; antidiarrhoeic; anti-HIV; dermatological; wasotropic; anti-inflammatory; antidiarrhoeic; anti-HIV; dermatological; KW anti-diabetic; osteopathic; antibacterial; immunomodilator; hypertensive; tranquiliser; antilipaemic; nephrotropic; antiulcer; antiarthritic; KW hypotensive; anorectic; antidiadictive; dopamine receptor agonist; lung cancer; glioma; anorexia; kW hypothyroidism; hyperaldosteronism; Helicobacter pylori proliferation; acromegaly; restenosis; Crohn's disease; systemic sclerosis; pancreatic pseudocyst; ascite; VIPoma; nesidoblastosis; hyperinsulinism; kW pancreatic pseudocyst; ascite; VIPoma; nesidoblastosis; hyperinsulinism; kW agastrinoma; Zollinger-Ellison Syndrome; diarrhoea; seleroderma; kW irritable bowel syndrome; pancreatitis; small bowel obstruction; miritable bowel syndrome; pancreatitis; small bowel obstruction; gastroseophageal reflux; dusedenogastric reflux; Cushing's syndrome; kW diabetic neuropathy; Paget's disease; polycystic ovary disease; kW diabetic neuropathy; Paget's disease; polycystic ovary disease; kW chrostatic; hypotension; poetprandial hypotension; panic attack; kW hypotension; poetprandial hypotension; panic attack; kW hyperlipidaemia; insulinoma; glucagonoma; diabetes mellitus; kW proliferative retinopathy; dawn phenomenn; nephropathy; merceting adenoma; insulinoma; nephropathy; pancreaticocttaneous fistula; menipidaemia; insulining syndrome; nephropathy; pancreaticocttaneous fistula; pancreaticocttaneous fistula; enterrocusaneous fistula;
                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
glucagonoma, diabetes mellitus, hyperlipidaemia, insulin insensitivity, Syndrome X, angiopathy, proliferative retinopathy, dawn phenomenon, rephropathy, gastric caid secretion, peptic ulcer, entercoutaneous fistula, pancreaticocutaneous fistula, dumping syndrome, watery diarrhoea syndrome, pancreaticicutaneous fistula, dumping syndrome, watery diarrhoea syndrome, parteries, allografit rejection, graft vessel bleeding, portal hypertension, graft vessel bleeding, portal hypertension, gastrointestinal bleeding, obesity and opioid overdose. The compounds shullaneously elicit dopamine receptor agonist and somatostatin receptor agonist effects in vivo with enhanced biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "D-form residue.            fistula, pancreaticocutaneous fistula, dumping syndrome, watery diarrhoea syndrome, pancreaticis, gastrointestinal hormone secreting tumour, analogomessis, arthritis, allograft rejection, graft vessel bleeding, portal hypertension, gastrointestinal bleeding, obseity and opioid overdose. The compounds simultaneously elicit dopamine receptor agonist and somatostatin receptor agonist effects in vivo with enhanced biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          'note= "1251-Succinoyl-Aspartic acid, D-form residue"

The present sequence is that of somatostatin analogue peptide JF-08-73.

It is an example of peptide agents of the invention that comprise a biologically active peptide, such as somatostatin or bombesin, conjugated to a chemical compound through a linker that maintains the peptide's biological activity. The peptide agents may also include a cytostatic or therapeutic agent, Tabel or chelating group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, tumours of neuroendocrine origin (for e.g. carcinoid syndrome), and angiogenic blood vessels (claimed). Other diseases that can also be treated are inflammatory bowel disease, autoimmune disorders, rheumatoid architis, neoplastic cells or aberrantly proliferating cells, and architis, neoplastic cells or aberrantly proliferating cells, and architis, neoplastic blood vessel in normal tissue including liver, but rapid and biodistribution of hydrophilic peptide agents. A lack of accumulation of radiocativity was noted in normal tissue including liver, but rapid and high efficiency elimination of the peptide as SEQ ID 11 in the disclosure between the sequence given as SEQ ID 11 in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present sequence is that of a somatostatin analogue peptide. It is an example of peptide agents of the invention that comprise a biologically active peptide, such as somatostatin or bombesin, conjugated to a chemical compound through a linker that maintains the peptide set in the peptide agents may also include a cytostatic or therapeutic agent, label or chelating group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, tumours of neuroendocrine origin (for e.g. carcinoid syndrome), and treated are inflammatcry bowel disease, autoimmune disorders, rheumatcid arthritis, neoplastic cells or aberrantly proliferating cells, and arthritis, neoplastic cells or aberrantly proliferating cells, and carchitistic, neoplastic cells or aberrantly proliferating cells, and carchitister primary cultures of rat pituitary cells, having an ICSO of 0.27 nM (compared with 0.15 nM for somatostatin-14)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Biologically active peptides such as somatostatin or bombesin conjugated to chemical compounds through linkers, useful for treating tumors of the lung and breast, carcinoid syndrome, and tumors of angiogenic blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "C-terminal amide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sun L;

The present sequence is that of a somatostatin analogue peptide. It is an example of peptide agents of the invention that comprise a biologically active peptide, such as somatostatin or bombesin. conjugated to a chemical compound through a linker that maintains the peptide to a biological activity. The peptide agents may also include a cytostatic or therapeutic agent, label or chelating group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, tumours of neuroendocrine origin (for e.g. carcinoid syndrome), and anglogenic blood vessels (claimed). Other diseases that can also be treated are inflammatory bowel disease, autoimmune disorders, rheumatoid arthritis, neoplastic cells or aberrantly proliferating cells, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Somatostatin; acromegaly; radiolocalisation; blood-brain barrier; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Biologically active peptides such as somatostatin or bombesin conjugated to chemical compounds through linkers, useful for treating tumors of the lung and breast, carcinoid syndrome, and tumors of angiogenic blood vessels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 30;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 10 AA;
  The invention provides for conventional somatostatin analogues (AAW48638-W48640 and AAW48664) and multi-tyrosinated analogues (AAW48641-W48645) such as the present one. The multi-tyrosinated somatostatin analogues bind to somatostatin receptors with practically the same affinity as the present one. The somatostatin analogues are claimed to be useful for native somatostatin. The somatostatin analogues are claimed to be useful for for treating disease associated with increased production of factors which can be regulated by somatostatin, e.g. acromegaly. Also when adiagnosting cancer in vitro or in situ where aberrant expression of somatostatin receptors is involved. When halogenated, these analogues are found to bind somatostatin receptors with such high affinity that binding is nearly irreversible under physiological conditions. Therefore, by using radioactive halogenated analogues, the invention claims for the moreoved sensitivity of radiolocalisation of the receptors whitityrostadiation analogues have increased half-lives in vivo relative to conventional somatostatin analogues, are resistant to enzymatic degradation and have increased blood-brain barrier penetration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              somatostatin-dopamine chimeric analogue; agonist; cyclic; vascular disease; angiogenesis; connective disease; scleroderma; immune disease; rheumatoid arthritis; gastrointestinal tract disorder; irritable bowel syndrome; metabolic disease; hyperlipidaemia; cachexia; cancer; musculoskeletal disorder; panic disorder; opioid overdose; cytosteatic; osteopathic; antithyroid; vasotropic; antiangiogenic; ophthalmological; antidiabetic; dermatological; immunosuppressive; antiarthritic; antirheumatic; antiinflammatory; antiuloer;

/note= "An N-terminal dopamine derivative (Dopl, Dop2 or Dop5) is attached to a Lys (dopamine derivative) modified residue, where this second dopamine derivative must match the type occurring at the N-terminus, e.g. Dop1-Lys(Dop1), Dop2-Lys(Dop2) etc. Optionally Lys can be a D-form residue." to treat neoplasia and acromedaly as well as various neuroendocrine tumours, vascular diseases e.g. angiogenesis, connective diseases e.g. theumatorial connective diseases e.g. theumatorial arthritis gastrointestinal tract disorders e.g. irritable bowel syndrome, metabolic diseases e.g. hyperlipidaemia, cachexis, cancer, a musculoskeletal disorder, panic disorder or an opioid overdose. Accordingly, they exhibit activities that include cytostatic, osteopathic, antithyroid, vasocropic, antiangiogenic, ophthalmological, antitheumatic, antiinflammatory, antiulocs, antianginganic, antidiabetic, hepatotropic, antilities antidiarchoeic, nephrotropic, hepatotropic, antilities antidiarchoeic, nephrotropic, hepatotropic, cardiant, tranquillizer and This invention relates to novel somatostatin-dopamine chimeric analogues that comprise at least one moiety that binds to one or more somatostatin receptors and at least one moiety that binds to one or more dopamine receptors, or a salt derived thereof. Specifically, it refers to analogues that may be used in vitro or in vivo for research, diagnostic and therapeutic agents to enhance the activity of somatostatin and dopamine i.e. working as receptor agonists. The present invention describes analogues with specificity for different types of somatostatin receptor subtypes that are accordingly associated with the treatment of particular diseases or conditions. As such, these analogues may be used New chimeric analog comprising at least one moiety which binds to one or more somatostatin and dopamine receptor(s) useful to treat e.g. neuroendocrine tumor, vascular diseases, connective tissue disease, antiaddictive. This peptide sequence is a somatostatin-dopamine chimeric antidiarrhoeic; nephrotropic; hepatotropic; antilipaemic; analgesic; antianginal; anorectic; immunomodulator; cardiant; tranquillizer; antiaddictive; acromegaly; neoplasia; neuroendocrine tumour. note = This disulphide bond cyclises the peptide /note= "C-terminal amide" (SCRC ) SAS SOC CONSEILS RECH & APPL SCI. that comprise at least one moiety that binds to one or more somatostating receptors and at least one moiety that binds to one or more dopamine receptors, or a salt derived thereof. Specifically, it refers to analogues that may be used in vitro or in vivo for research, diagnostic and therapeutic agents to enhance the activity of somatostatin and dopamine i.e. working as receptor agonists. The present invention describes analogues with specificity for different types of somatostatin and describes analogues with specificity for different types of somatostatin receptor subtypes that are accordingly associated with the treatment of particular diseases or conditions. As such, these analogues may be used to treat neoplasia and acromegaly as well as various neuroendocrine tumours, vascular diseases e.g. angiogenesis, connective diseases e.g. cleroderma, immune diseases e.g. rheumatoid arthritis, gastrointestinal tract disorders e.g. irritable bowel syndrome, metabolic diseases e.g. hyperlipidaemia, cachexia, cancer, a musculoskeletal disorder, panic cohexia, cancer, antithyroid, vasotropic, antitableselet, ophthalmological, antidiabetic, dermatological, immunosuppressive, antidiatartheit, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antithemmatic, antith
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               attached to a Lys (dopamine derivative) modified residue, where this second dopamine derivative must match the type occurring at the N-terminus, i.e. Dop2-Lys (Dop2). Optionally Lys can be a D-form residue."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antiaddictive. This peptide sequence is a somatostatin-dopamine chimeric analogue of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   somatostatin-dopamine chimeric analogue; agonist; cyclic; vascular disease; angiogenesis; connective disease; soleroderma; immune disease; rheumatoid arthritis; gastrointestinal tract disorder; irritable bowel syndrome; metabolic disease; hyperlipidaemia; cachexia; cancer; musculoskeletal disorder; panic disorder; optoid overdose; cytoetatic; osteopathic; antithyridd; vasotropic; antiangiogenic; ophibalmological; antidiabetic; dermatological; immunosuppressive; antiarthritic; antirheumatic; antiinflammatory; antiuloer; antidartholic; nephrotropic; harbitatoric; papatotropic; antilipeamic; analgesic; antianginal; anorectic; immunomodulator; cardiant; tranquillizer; antiaddictive; acromegaly; neoplasia; neuroendocrine tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /label= OTHER

Polypeptide(s) contg. cysteine-terminal hexa:peptide fragment - useful as growth-hormone, gastric and pancreatic secretion inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The peptide inhibits growth hormone secretion and can be used to treat diabetes, angiopathy and acromegaly. It also inhibits gastric and pancreatic secretion and can be used to treat gastrointestinal disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to novel somatostatin-dopamine chimeric analogues
that comprise at least one moiety that binds to one or more somatostatin
creceptors and at least one moiety that binds to one or more dopamine
receptors or a salt derived thereof. Specifically, it refers to
analogues that may be used in vitro or in vivo for research, diagnostic
and therapeutic agents to enhance the activity of somatostatin and
dopamine i.e. working as receptor agonists. The present invention
describes analogues with specificity for different types of somatostatin
receptor subtypes that are accordingly associated with the treatment of
particular diseases or conditions. As such, these analogues may be used
to treat neoplasia and acromegaly as well as various neuroendocrine
tumours, vascular diseases e.g. angiogenesis, connective diseases e.g.
tract disorders e.g. irritable bowel syndrome, metabolic diseases e.g.
tract disorders e.g. irritable bowel syndrome, metabolic diseases e.g.
hyperlipidaemia, cachexia, cancer, a musculoskeletal disorder, panic
disorder or an opicid overdose. Accordingly, they exhibit activities that
include cytostatic, osteopathic, antithyroid, vasotropic, antiangiogenic,
ophthalmological, antidiabetic, dermatological, immunosuppressive,
antianthritic, antirheumatic, antiinflammatory, antilizer,
antiandinal, anorectic, immunomodulator, cardiant, tranquillizer and
antiandictive. This peptide sequence is a somatostatin-dopamine chimeric
analogue of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New chimeric analog comprising at least one moiety which binds to one or more somatostatin and dopamine receptor(s) useful to treat e.g. neuroendocrine tumor, vascular diseases, connective tissue disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                             note = This disulphide bond cyclises the peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

Polypeptide(s) contg. a hepta:peptide defined fragment - are growth hormone secretion inhibitors, used to treat ulcers, diabetes, anglopathy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The peptides of the invention are used in the treatment of diabetes, angiopathy, acromegalia and gastro-intestinal disorders, such as gastric
                                                                                                                          Polypeptide derivs. contg. two cysteine residues - inhibiting secretion of growth hormone and gastric and pancreatic secretions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Diabetes therapy; angiopathy; acromegalia; gastric ulcer; pancreatitis.
                                                                                                                                                                                                     The peptide inhibits the secretion of somatotropin and so can be used treat diabetes mellitus, angiopathy and acromegalia. It also inhibits gastric and pancreatic secretions so is useful in the treatment of gastric ulcers, gastro-intestinal bleeding and acute pancreatitis
                                                                                                                                                                                                                                                                                                                                              Gaps

An H is attached to D-Phe and OH to Thr. Deriva of this sequence substd. on the N-terminal amino gp. by N alpha-(alpha-glucosyl(1-4)deoxyfructosyl) or N alpha-(beta-deoxyfructosyl) are pref. for oral administration. The cpds are esp. used to prevent, inhibit or treat respiratory distress syndrome in children and adults, and to inhibit or treat lung damage caused by oxygen therapy. Opt. they are formulated with a glucocorticoid steroid. The y are also known to inhibit release of growth hormone, insulin, and glucagon, and to reduce gastric secretions.
